

GWconnect® Push In technology offers the quickest wiring time of Heavy Duty Connectors, as the end user does not need any tool to wire the contacts or open the clamps.

Save your time and costs with the GWconnect Push In inserts. You just have to insert the wire into the clamp hole and the connection is completed. No tool or leaning-surface is needed for the wiring and the connection is reliable, strong and vibration-proof. Up to 80% of assembling time is saved in comparison with the standard screw type inserts.

The clamping point in the front allows wiring, maintenance and electrical tests without releasing the insert from the Heavy Duty Connector enclosure. The high contact force between the conductor and the current bar is

guaranteed by a stainless steel compression clamp, which gives a 100% safe connection.

The Push In insert series is available for the complete range of sizes from 6B to 48B and is suitable for both solid and stranded wires with bush terminals. For wires from 1.5mm² the connection is possible also without bush terminals.

Less time. More performance. Just push the wire in!
